

IMPROVED DURABILITY

Customized Bearings

As just mentioned, durability is mainly a factor to bear in mind when developing a hub. Depending on the hub design, one can influence how prone the used bearings are to wear and tear.

To be able to keep the bearings safe from dirt and water, we developed our own system. We cover the bearing sides next to the axle end-caps and use our own seals and grease inside the bearings. We do further use SKF industrial bearings as a standard and offer CeramicSpeed bearings as an upgrade.

This, in total, helps us to optimize the durability of the hubs.
